Nucleoside Derivatives

The invention relates to nucleoside derivatives as inhibitors of HCV Replicon RNA replication. In particular, the invention is concerned with novel and known purine and pyrimidine nucleoside derivatives, their use as inhibitors of subgenomic Hepatitis C Virus (HCV) RNA replication and pharmaceutical compositions of such compounds. For the novel purine and pyrimidine nucleoside derivatives the invention is also concerned with a process for their manufacture, pharmaceutical compositions and the use of such compounds in medicine. The compounds of this invention have potential use as therapeutic agents for the treatment of HCV infections.

Hepatitis C virus is the leading cause of chronic liver disease throughout the world. Patients infected with HCV are at risk of developing cirrhosis of the liver and subsequent hepatocellular carcinoma and hence HCV is the major indication for liver transplantation. Only two approved therapies are currently available for the treatment of HCV infection (R.G. Gish, Sem.Liver.Dis., 1999, 19, 35). These are interferon-α monotherapy and, more recently, combination therapy of the nucleoside analogue, ribavirin (Virazole), with interferon-α.

Ribavirin is a broad spectrum antiviral agent with activity against a range of DNA and RNA viruses (R.A.Smith and W. Kirkpatrick (Eds.): *Ribavirin – A Broad Spectrum Antiviral Agent*, Academic Press, New York, 1980) but its mechanism of action has not been conclusively established and a number of distinct properties of ribavirin have been identified which may vary in relative importance for differing viral disease conditions. These properties include mediation of the immune response (C. D. Hultgren et al, J.Gen.Virol., 1998, 79, 2381), lowering of serum alanine aminotransferase (ALT) levels (G. Dusheiko et al, J. Hepatol.,1996, 25, 591), inhibition as the monophosphate of inosine monophosphate dehydrogenase

(IMPDH) (D.G.Streeter et al, Proc.Natl.Acad.Sci., 1973, 70,1174) and direct inhibition of viral DNA or RNA replication (R.W.Sidwell et al, Science, 177,705).

Many of the drugs approved for the treatment of viral infections are nucleosides or nucleoside analogues and most of these nucleoside analogue drugs inhibit viral replication, following conversion to the corresponding triphosphates, through inhibition of the viral polymerase enzymes. This conversion to the triphosphate is commonly mediated by cellular kinases and therefore the direct evaluation of nucleosides as inhibitors of HCV replication is only conveniently carried out using a cell-based assay. For HCV the availability of a true cell-based viral replication assay or animal model of infection is lacking.

Hepatitis C virus belongs to the family of Flaviridae. It is an RNA virus, the RNA genome encoding a large polyprotein which after processing produces the necessary replication machinery to ensure synthesis of progeny RNA. It is believed that most of the non-structural proteins encoded by the HCV RNA genome are involved in RNA replication. Lohmann et al. [V. Lohmann et al., Science, 1999, 285, 110-113] have described the construction of a Human Hepatoma (Huh7) cell line in which subgenomic HCV RNA molecules have been introduced and shown to replicate with high efficiency. It is believed that the mechanism of RNA replication in these cell lines is identical to the replication of the full length HCV RNA genome in infected hepatocytes. The subgenomic HCV cDNA clones used for the isolation of these cell lines have formed the basis for the development of a cell-based assay for identifying nucleoside analogue inhibitors of HCV replication.

The compounds of formula I have been shown to be inhibitors of subgenomic Hepatitis C Virus replication in a hepatoma cell line. These compounds have the potential to be efficacious as antiviral drugs for the treatment of HCV infections in human.

This object can be achieved by use of compounds of formula I

In the pictorial representation of the compounds given throughout this application, a thickened tapered line (▼) indicates a substituent which is above the plane of the ring to which the asymmetric carbon belongs, a dotted line (---) indicates a substituent which is below the plane of the ring to which the asymmetric carbon belongs, and a wavy line (~) indicates a substituent which can be either above or below the plane of the molecule. It is to be understood that the pictorial representation of the compounds given throughout the specification are set forth for convenience and are to be construed as inclusive of other forms including stereoisomers, enantiomers and racemates and are not to be construed as limited to the particular form shown.

Compounds of formula I exhibit stereoisomerism. The compounds of this invention can be any isomer of the compound of formula I or mixtures of these isomers. The compounds and intermediates of the present invention having one or more asymmetric carbon atoms may be obtained as racemic mixtures of stereoisomers which can be resolved, at the appropriate steps in the process of this invention by methods known in the art to obtain a given stereoisomer or pure enantiomer having a desired stereoconfiguration. Alternatively, the desired isomers may be directly synthesised by methods known in the art.

Asymmetric carbon atoms in the compounds of the present invention are denoted as a, b, c and d. The stereoconfiguration of each of the asymmetric carbon atoms denoted as a, b, c, and d can be designated according to the particular stereoisomer it represents. Compounds of the present invention include those

compounds wherein the carbon atom denoted as "a" has the S, R, or R,S-configuration; the carbon atom denoted as "b" has the S, R, or R,S-configuration; the carbon atom denoted as "c" has the S, R, or R,S-configuration; and the carbon atom denoted as "d" has the S, R, or R,S-configuration. Preferably a, b, c and d denoting asymmetric carbon atoms and forming an α-D or β-D ribofuranosyl ring and most preferred, β-D ribofuranosyl ring.

Compounds of formula I exhibit tautomerism that means that the compounds of this invention can exist as two or more chemical compounds that are capable of facile interconversion. In many cases it merely means the exchange of a hydrogen atom between two other atoms, to either of which it forms a covalent bond. Tautomeric compounds exist in a mobile equilibrium with each other, so that attempts to prepare the separate substances usually result in the formation of a mixture that shows all the chemical and physical properties to be expected on the basis of the structures of the components.

The most common type of tautomerism is that involving carbonyl, or keto, compounds and unsaturated hydroxyl compounds, or enols. The structural change is the shift of a hydrogen atom between atoms of carbon and oxygen, with the rearrangement of bonds as indicated.

For example, in many aliphatic aldehydes and ketones, such as acetaldehyde, the keto form is the predominant one; in phenols, the enol form is the major component. An intermediate situation is represented for example in ethyl acetoacetate, which at room temperature contains about 92.4 percent keto and 7.6 percent enol; at -78° C, the interconversion of the two forms is slow enough for the individual substances to be isolated.

It will be appreciated that within the present invention compounds of formula I exist in various tautomeric forms and that they are encompassed by the present invention.

The compounds of formula I according to the present invention are prepared as follows:

The compounds of formula I may be prepared by various methods known in the art of organic chemistry in general and nucleoside analogue synthesis in particular. The starting materials for the syntheses are either readily available from commercial sources or are known or may themselves be prepared by techniques known in the art. General reviews of the preparation of nucleoside analogues are included in the following:

A M Michelson "The Chemistry of Nucleosides and Nucleotides", Academic Press, New York 1963.

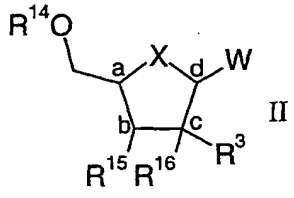
The synthesis of carbocylic nucleosides has been reviewed by: L Agrofoglio et al Tetrahedron, 1994, 50, 10611.

The strategies available for the synthesis of compounds of formula I include:

1. Condensation of a protected furanose, thiofuranose or cyclopentane derivative of formula II



II

wherein

R^3 is as defined above;

R^{14} is a hydroxy protecting group;

R^{15} is as defined for R^1 except that when R^1 is hydroxy R^{15} is a group OR^{17} wherein R^{17} is a hydroxy protecting group;

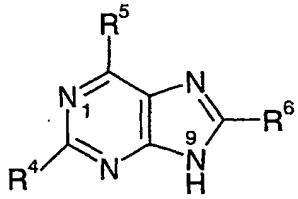
R^{16} is as defined for R^2 except that when R^2 is hydroxy R^{16} is a group OR^{17} wherein R^{17} is a hydroxy protecting group;

X is O, S or CH_2;

W is a leaving group such as acyloxy, aryloxy, alkylsulphonate, arylsulphonate, S-benzyl or halogen; and

a, b, c, d denoting asymmetric carbon atoms each of which is substituted with 4 different substituents;

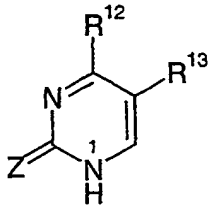
with an appropriate purine of formula III



III

wherein R^4, R^5 and R^6 are as defined in formula I;

or pyrimidine of formula IV



IV

wherein Z, R^{12} and R^{13} are as defined in formula I;

or a derivative of the purine or pyrimidine such as for example a heavy metal or silyl derivative.

The particular nature of the hydroxy protecting groups R^{14} or R^{17} is selected in accordance with conventional techniques. Examples for hydroxy protecting groups are acyl (e.g. acetyl), aroyl (e.g. benzoyl), ether (e.g. bis-acetonide), silylether (e.g. trimethylsilyl, tert-butyldimethylsilyl) or arylmethyl (e.g. benzyl, triphenylmethyl).

The condensation reaction may be performed using standard methods including the use of a Lewis acid catalyst such as mercuric bromide or stannic chloride or trimethylsilyltrifluoromethane sulphonate in solvents such as acetonitrile, 1,2-dichloroethane, dichloromethane, chloroform or toluene at reduced, ambient or elevated temperature. Examples for the condensation reaction of a protected furanose or thiofuranose of formula II where X is O or S with an appropriate pyrimidine or purine derivative are as follows:

a) The reaction may be performed by the condensation of heavy metal derivatives of purines of formula III or pyrimidines of formula IV (e.g. chloromercuri derivatives) with a compound of formula II as described by J Davoll and B A Lowry J Am Chem Soc 1951, 73, 1650; J J Fox, N Yung, J Davoll and G B Brown J Am Chem Soc 1956, 78, 2117.

b) The reaction may also involve the condensation of alkoxy pyrimidines with compounds of formula II as described by K A Watanabe, D H Hollenberg and J J Fox Carbohydrates, Nucleosides and Nucleotides 1974, 1,1.

c) The reaction may be performed by the condensation of silyl derivatives of purines of formula III or pyrimidines of formula IV with compounds of formula II as described by U Niedballa and H Vorbruggen J Org Chem 1976, 41, 2084; U Niedballa and H Vorbruggen J Org Chem 1974, 39, 3672. A J Hubbard, A S Jones and R T Walker Nucleic Acids Res 1984, 12, 6827.

d) Fusion of per-acylated sugars with purines under vacuum in the presence of p-toluene sulphonic acid has been described by T Simadate, Y Ishudo and T Sato Chem Abs 1962, 56, 11 692 and W Pfleiderer, R K Robins Chem Ber 1965, 98, 1511.

e) Further coupling reactions have been described by K A Watanabe, D H Hollenberg and J J Fox Carbohydrates, Nucleosides and Nucleotides 1974, 1,1.

Examples for the condensation reaction of a protected cyclopentane derivative of formula II wherein X is CH_2 with an appropriate purine derivative of formula III or pyrimidine derivative of formula IV are as follows:

a) The nucleophilic displacement of the leaving group W in a compound of formula II where X is CH_2 with a purine derivative of formula III or pyrimidine

derivative of formula IV as described by H Kapeller, H Baumgartner and H Griengl, Monattsh Chem,1997, 128, 191 and P Wang et al, Tet Lett 1997, 38, 4207.

b) The reaction of a cyclopentane derivative of formula II in which W is OH with a purine derivative under Mitsonobu conditions, which employs a triarylphosphine such as triphenyl phosphine and a diazodicarboxylic acid diester such as diethyl azodicarboxylate as reagents, as described by T Jenny et al Helv Chim Acta 1992, 25, 1944.

Such methods often result in mixtures of anomeric nucleoside derivatives which can be separated by standard techniques known to the art such as recrystallisation, column chromatography, high performance liquid chromatography or super critical fluid chromatography.

The purine derivatives of formula III and pyrimidines derivatives of formula IV for above condensation reactions can be obtained commercially or can be prepared by procedures known to the art.

The preparation of purine derivatives of formula III is reviewed by G Shaw in "Comprehensive Heterocyclic Chemistry" pub Pergamon Press Vol. 5 chapter 4.09, p 499 and "Comprehensive Heterocyclic Chemistry II" pub Pergamon Press Vol 7, chapter 7.11 p 397.

The preparation of pyrimidines derivatives of formula IV is reviewed by D J Brown "The Chemistry of Heterocyclic Compounds – The Pyrimidines" 1962 and Supplement 1, 1970, pub John Wiley and Sons, New York, by D J Brown in "Comprehensive Heterocyclic Chemistry" pub Pergamon Press Vol. 5 chapter 4.09, p 499 and by K Unheim and T Benneche in "Comprehensive Heterocyclic Chemistry II" pub Pergamon Press Vol. 6 chapter 6.02 p 93.

For example the appropriate purine base of formula III may be prepared from the corresponding purine wherein the 2, 6 or 8 position of the purine base is substituted with a suitable leaving group such as halogen or sulphonate. Such purine precursors bearing leaving groups are available commercially e.g. 6-chloropurine (Aldrich Chemical Company), 2,6-dichloropurine (Aldrich Chemical Company), 2-chloro-6-aminopurine (Aldrich Chemical Company), 8-bromoadenine (Sigma-Aldrich Company Limited) or obtained by procedures

known in the art. For example 2- and 6-chloro substituted purines can be prepared by chlorination of the corresponding 2 and 6-hydroxypurines respectively by the use of chlorinating agents such as phosphorus oxychloride (D S Bakuni et al Indian J Chem Sect B 1984, 23, 1286; M P LaMontagne et al J Heterocycl Chem 1983, 20, 295) while introduction of a bromine into the 8-position of purines can be accomplished by direct bromination using brominating agents such as for example bromine (M Mano et al, Chem Pharm Bull 1983,31, 3454) or N-bromosuccinimide (J L Kelley et al J Heterocycl Chem 1990,27,1505). The purines where the 6 substituent is alkoxy, aryloxy, SH, alkylthio, arylthio, alkylamino, cycloalkylamino, saturated cyclic amino, nitrogen linked heteroaromatic, hydroxylamino, alkoxylamino, hydrazine, alkylhydrazino may be prepared by treatment of the corresponding 6-halopurine with the appropriate alkoxides, thiols, amines, nitrogen containing heterocycles, hydroxylamines and hydrazines, (e g M-Y Chae et al J Med Chem, 1994, 37, 342; G Niebch and F Schneider, Z.Naturforsch. B. Anorg. Chem. Org. Chem. Biochem. Biophys. Biol. 1972,27, 675; M P LaMontagne et al, J Heterocycl Chem 1983, 20, 295; K G Estep et al J Med Chem 1995, 38, 2582). Similarly 2-substitued purines can be prepared from the corresponding 2-halopurine for example purines where the 2 substituent is alkoxy, aryloxy, SH, alkylthio, arylthio or NR^7R^8 can be prepared from the corresponding 2-halopurine by treatment with alkoxides, thiols or amines (e.g. G B Barlin and D M Fenn, Aust J Chem, 1983, 36, 633; D A Nugiel et al, J Org Chem, 1997, 62, 201) . Similarly 8-substitued purines can be prepared from the corresponding 8-halopurine. For example purines where the 8-substituent is alkoxy, aryloxy, SH, alkylthio, arylthio or NR^7R^8 can be prepared by treatment of the corresponding 8-bromopurine with the appropriate alkoxides, thiols or amines (Xing et al, Tet Lett, 1990, 31, 5849; M Mano et al, Chem Pharm Bull 1983,31, 3454). Where the 2, 6 or 8 substituent is a cyclic amine moiety the purine can be prepared from the 6-aminopurine by reaction with an appropriate dialkylating agent such as a dihaloalkane. In some cases where the 6-substituent is a nitrogen containing heteroaromatic linked through the nitrogen atom the purine may be prepared from the 6-aminopurine by reaction with a dicarbonyl compound or a reactive derivative of this such as an acetal. For example 6-(1H-pyrrol-1-yl)-1H-purine can be prepared from 6-chloropurine by reaction with 2,5-dimethoxytetrahydrofuran as described by K G Estep et al J Med Chem 1995, 38, 2582.

The furanose and thiofuranose derivatives of formula II used for the condensation reactions can be prepared by methods known in the art of carbohydrate chemistry.

Furanose derivatives can be prepared from commercially available carbohydrate starting materials such as the D or L forms of ribose, arabinose, xylose or lyxose. Following introduction of protecting groups which are compatible with the chemistry, modification of either the 2-hydroxy substituent or 3-hydroxy substituent is possible. For example direct alkylation with alkylating agents such as alkyl halides, alkyl sulphonates or diazoalkanes provides the corresponding O-alkyl derivatives as exemplified by M E Jung, C Castro, S I Khan, Nucleosides and Nucleotides; 1998, 17, 2383; G Parmentier, G Scmitt, F Dolle, B Luu Tet 1994, 50, 5361. Conversion of either hydroxy to a leaving group such as halo followed by reduction provides the 2- or 3-deoxysugar derivatives as described by K C Nicolaou et al J Am Chem Soc 1988, 110, 4672. Also conversion of either hydroxy to a leaving group such as halo or sulphonate by standard methods followed by displacement with nucleophilic reagents for example sodium or lithium azide to introduce an azido group (A M Ozols et al, Synthesis, 1980, 557). Direct introduction of a fluorine substituent can be accomplished with fluorinating agents such as diethylaminosulphur trifluoride as described by F Puech, G Gosselin and J-L Imbach Tet Lett 1989, 30, 3171 or conversion of the hydroxy substituent to a leaving group such as halo or sulphonate and displacement using reagents such as tetrabutylammonium fluoride as described in Tet Asym 1990,1 715.

3'-Alkyl substituted furanoses can be prepared by construction of the sugar ring from γ-hydroxymethyl-γ-butyrolactone as described by K Ayei-Aye and D C Baker, Carbohydr Res 1988, 183, 261 and by M Okabe et al J Org chem, 1988, 53, 4780. Alternatively, cyclohexenecarboxylic acid derivatives can be used as described by K C Schneider and S A Benner, Tet Lett, 1990, 31, 335.

3'-hydroxymethyl substituted furanoses can been synthesised from 3-[[(4-bromobenzyl)oxy]methyl]oxirane-2-methanol as described by L Svansson et al, J Org Chem 1991, 56,2993.

2,2-Difluorofuranose derivatives can be prepared from D-glucose or D-mannose as described by R Fernandez, M I Mateu, R Echarri and S Castillon Tet 1998, 54, 3523. The thiofuranose derivatives of formula II where X is S can be

prepared by literature procedures such as L Bellon, J L Barascut, J L Imbach Nucleosides and Nucleotides 1992, 11, 1467 and modified in a similar fashion to the furanose analogues described above.

The cyclopentane derivatives of formula II where X is CH_2 can be prepared by methods known in the art of organic chemistry and by methods and references included in L Agrofolio et al Tetrahedron 1994, 50, 10611.

Such methods include :

a) those which for example utilise furanosylamine derivatives as described by N J Cusack, B J Hildick , D H Robinson, P W Rugg and G Shaw JCS Perkin I 1973, 1720 or G Shaw, R N Warrener, M H Maguire and R K Ralph, J Chem Soc 1958, 2294.

b) those which utilise for example furanosylureas for pyrimidine nucleoside synthesis as described by J Šmejkal, J Farkas, and F Šorm Coll Czech Chem Comm 1966, 31, 291.

c) The preparation of purine nucleosides from imidazole nucleosides as reviewed by L B Townsend Chem Rev 1967, 67, 533.

d) the preparation of compounds of formula I wherein X is CH_2 can be accomplished from 1-hydroxymethyl-4-aminocyclopentane derivatives as described by Y F Shealy and J D Clayton J Amer Chem Soc 1969, 91, 3075; R Vince and S Daluge J Org Chem 1980, 45, 531; R C Cermak and R Vince Tet Lett 1981,2331; R D Elliott et al J Med Chem 1994,37, 739; A D Borthwick et al, J Med Chem 1990, 33, 179.

3. Modification or inter-conversion of preformed nucleosides.

A. Modification of the purine or pyrimidine base moiety.

Methods include:

a) the deamination of aminopurine or aminopyrimidine nucleosides as described by J R Tittensor and R T Walker European Polymer J 1968, 4, 39 and H Hayatsu Progress in Nucleic Acid Research and Molecular Biology 1976, Vol. 16, p75.

b) The conversion of the 4-hydroxy group of 4-hydroxypyrimidine nucleosides to a leaving group and displacement with nucleophilic reagents. Such leaving groups include halogen as described by J Brokes and J Beranek Col Czech Chem Comm 1974, 39, 3100 or 1,2,4-triazole as described by K J Divakar and C B Reece J Chem Soc Perkin Trans I 1982, 1171.

c) 5-substitution of pyrimidine nucleosides has been achieved by the use of 5-metallo derivatives such as 5-mercuri or 5-palladium for example as described by D E Bergstrom and J L Ruth J Amer Chem Soc 1976, 98, 1587. Introduction of fluoro into the 5 position of pyrimidine nucleosides can be achieved with reagents such as trifluoromethyl hypofluorite as described by M J Robins Ann New York Acad Sci 1975, 255, 104.

d) modified purine nucleosides may be prepared from the corresponding purine nucleoside derivatives wherein the 2, 6 or 8 substituent is a suitable leaving group such as halogen or sulphonate or 1,3,4-triazole. Thus the compounds for example where the purine 6 substituent is alkoxy, aryloxy, SH, alkylthio, arylthio, alkylamino , cycloalkylamino hydroxylamino, alkoxylamino or hydrazino may be prepared by treatment of the appropriate 6-halopurine or 6-(1,2,4-triazol-4-yl)purine nucleoside derivatives with the appropriate alcohols, thiols or amines, hydroxylamines or hydrazines. Such conversions are described by V Nair and A J Fassbender Tet 1993,49,2169 and by V Samano, R W Miles and M J Robins J Am Chem Soc 1994, 116, 9331. Where the 6 substituent is a cyclic amine or aromatic amine moiety the purine nucleoside analogue can be prepared from the 6-aminopurine nucleoside derivative by reaction respectively with an appropriate dialkylating agent such as a dihaloalkane or with a dicarbonyl compound or a reactive derivative of this such as an acetal. For example as described by M Haidoune and R Mornet J Heterocyclic Chem 1995, 31,1462. Similarly 8-substituted purine nucleosides can be prepared by treatment of the corresponding 8-

halopurine nucleoside with the appropriate nucleophilic reagent for example alkoxides, thiols or amines as described by L Tai-Shun, C Jia-Chong, I Kimiko and A C Sartorelli J Med Chem 1985, 28, 1481; Nandanan et al J Med Chem 1999,42,1625; J Jansons, Y Maurinsh, and M Lidaks Nucleosides and Nucleotides 1995, 14, 1709. Introduction of a 8-cyano substituent can be accomplished by displacement of using a metal cyanide as described by L-L Gundersen, Acat Chem Scand 1996, 50, 58. 2-modified purine nucleoside may be prepared in a similar fashion as described by T Steinbrecher, C Wamelung, F Oesch and A Seidl Angew Chem Int Ed Engl 1993, 32, 404.

e) Where the substituent at the 2, 6 or 8-position of the purine nucleoside is linked via a carbon carbon bond e.g. alkyl or aryl then metal catalysed cross-coupling procedures can be used starting with the appropriate 2, 6 or 8-halosubstituted purine nucleoside analogue. Such procedures are described by AA Van Aerschott, et al J Med Chem 1993, 36, 2938; D E Bergstrom and P A Reday Tet Lett 1982, 23, 4191.M Hocek, A Holy, I Votruba and H Dvarakova J Med Chem 2000, 43, 1817.C Tu, C Keane and B E Eaton Nucleosides and Nucleotides 1995, 14, 1631.

f) Oxidation of the 3-nitrogen in pyrimidine nucleoside analogues or 1-nitrogen in purine nucleoside derivatives can be accomplished using hydrogen peroxide or organic peroxides as described by G B Brown Progress in Nucleic Acid Research and Molecular Biology ed J N Davidson and W E Cohn, Academic Press, New York 1968, 8, 209.

g) Alkylation of the 3-nitrogen in uracil nucleoside analogues can be accomplished using alkylating agents such as diazoalkanes (Miles, Biochim Biophys Acta, 1956, 22, 247), alkyl sulphonates (Scannel et al, Biochim Biophys Acta, 1959, 32, 406) or alkyl halides (Anderson et al J Chem Soc 1952, 369). Alkylation of the 3-nitrogen in cytosine nucleoside analogues can similarly be accomplished using alkylating agents such as trialkyl sulphonium halides (K Yamauchi, J Chem Soc Perkin Trans 1, 1980, 2787) or epoxides (W Zhan et al Chem Res Toxicol, 1998, 8, 148). Similarly alkylation of purine nucleoside analogues on the 1-nitrogen can be accomplished using alkylating agents such as alkyl halides (W A Szarek et al Can J Chem 1985, 63, 2149) or alkyl sulphonates (M Kawana et al J Chem Soc Perkin Trans 1, 1992, 4, 469). Aryl substituents can be

introduced onto the 1-nitrogen of purine nucleosides or the 3-nitrogen of pyrimidine nucleosides by direct arylation using aryl halides in the presence of a copper catalyst such as copper(I) oxide as described for example by T Maruyama et al, Nucleosides and Nucleotides, 1997, 16, 1079 and by T Maruyama et al J Chem Soc Perkin Trans I, 1995, 733.

4. B. Modification of the carbohydrate moiety.

Methods include:

a) Following introduction of protecting groups which are compatible with the further chemistry, modification of either the 2'-hydroxy substituent or 3'-hydroxy substituent in the nucleoside analogue is possible. For example direct alkylation with alkylating agents such as alkyl halides, alkyl sulphonates or diazoalkanes provides the corresponding O-alkyl derivatives as exemplified by C G Edmonds et al J Chem Soc Chem Comm 1987, 12, 909; P J L M Quaedfieg et al J Org Chem 1991, 56, 5846. Conversion of either hydroxy to a leaving group such as halo by reaction with for example triphenyl phosphine and a tetrahaloalkane as described for example by L De Napoli et al, Nucleosides and Nucleotides, 1993, 12, 981, followed by reduction provides the 2- or 3-deoxysugar derivatives as described by D G Norman and C B Reese, Synthesis 1983, 304. Alternatively derivatisation of the hydroxy function by conversion to a thiocarbonate group such as phenoxy thiocarbonate or imidazoylthiocarbonate followed by reduction using free radical reducing agents such as trialkyltin hydrides as described by D H R Barton and R Subranian J Chem Soc Chem Comm 1976, 867. Direct introduction of a fluorine substituent can be accomplished with fluorinating agents such as diethylaminosulphur trifluoride as described by P Herdewijn, A Van Aerschot and L Kerremans Nucleosides and Nucleotides 1989,8, 65. Conversion of the hydroxy substituent to a leaving group such as halo or sulphonate also allows displacement using nucleophilic reagents such as tetrabutylammonium fluoride, lithium azide, tert butyl isocyanide or metal cyanides as exemplified by H Hrebabecky, A Holy and e de Clercq Collect Czech Chem Comm 1990, 55, 1800; K E B Parkes and K Taylor Tet Lett 1988, 29, 2995. Such nucleophilic reactions can also be carried out on 2',3'-epoxynucleosides as exemplified by Huang et al J Med Chem

1991, 34, 1640 or using 2,3'-anhydropyrimidine nucleosides as typified by Colla et al Eur J Med Chem Chim Ther 1985, 20, 295.

b) Following introduction of appropriate protecting groups on the 3' and 5'-hydroxy groups of a preformed nucleoside it is possible to oxidise the unprotected 2'-hydroxy group to a ketone using methods similar to those described by F Hansske, M D Fritz and M J Robins, Tetrahedron 1984, 40, 125. Reaction of the resultant 2'-keto nucleoside with olefination reagents such as methyl triphenyl phosphonium bromide in the manner of S Czernecki, L Mulard, J-M Valery, and A Commercon, Can.J.Chem 1993, 71, 413 provides the 2'-deoxy-2'-methylidenenucleoside derivatives.

c) Reaction of 2'-keto nucleosides with fluorinating agents such as diethylamino sulfur trifluoride can be used to prepare 2',2'-difluoronucleosides as described by D Bergstrom, E Romo and P Shum Nucleosides and Nucleotides 1987, 6,53.

d) The principal methods of introducing an alkyl group into the 3'-position of nucleosides involve, free-radical coupling of protected nucleosides which are suitably derivatised in the 3'-position, for example from 3'-iodonucleosides as described by D Yu and M d'Alarco, J Org Chem 1989,54,3240 or from 3'-O-phenoxythiocarbonyl nucleosides as described by J Fiandor and S Y Tam, Tet Lett, 1990,31, 597 and C K Chu et al, J Org Chem, 1989,54, 2767, or through addition of cyanide to 3'-ketonucleosides as described by M J Camarasa et al, J Med Chem, 1989, 32, 1732. A 3'-hydroxymethyl substituent can be introduced by reduction of the corresponding 3'-C-formyl nucleoside as described by M J Bamford et al, J Med Chem, 1990, 33, 2494. The 3'-C-formyl nucleoside can be produced in turn by elaboration of 3'-keto nucleosides or from 2',3'-anhydronucleosides.

The preformed nucleoside derivatives are either available commercially or synthesised in accordance with the methods described above.

Also part of this invention are novel purine and pyrimidine nucleoside derivatives, a process for their manufacture, pharmaceutical compositions and the use of such compounds in medicine. The novel purine and pyrimidine nucleoside derivatives of formula I have been shown to be inhibitors of subgenomic Hepatitis C Virus replication in a hepatoma cell line. These compounds have the potential to be efficacious as antiviral drugs for the treatment of HCV infections in human. Accordingly, the present novel purine and pyrimidine nucleoside derivatives of formula I are therapeutically active substances in the treatment of HCV infections in human and can be used as medicaments for the treatment of such disease.

The novel purine and pyrimidine nucleoside derivatives of formula I can as well be used as medicaments, especially for treating immune mediated conditions or diseases, viral diseases, bacterial diseases, parasitic diseases, inflammatory diseases, hyperproliferative vascular diseases, tumors, and cancer.

In particular, compounds of the present invention and pharmaceutical compositions containing the same are useful as chemotherapeutic agents, inhibitors of viral replication and modulators of the immune system, and can be used for the treatment of viral diseases such as retroviral infections and hepatitis C virus infections (either alone or in combination with other antiviral agents such as interferon or derivatives thereof, such as conjugates with polyethylene glycol).

They can be used alone, or in combination with other therapeutically active agents, for example, an immunosuppressant, a chemotherapeutic agent, an anti-viral agent, an antibiotic, an anti-parasitic agent, an anti-inflammatory agent, an anti-fungal agent and/or an anti-vascular hyperproliferation agent.

Any functional (i.e. reactive) group present in a side-chain may be protected, with the protecting group being a group which is known per se, for example, as described in "Protective Groups in Organic Synthesis", 2nd Ed., T.W. Greene and P.G.M. Wuts, John Wiley & Sons, New York, NY, 1991. For example, an amino group can be protected by tert.-butyloxycarbonyl (BOC) or benzyloxycarbonyl (Z).

The compounds of this invention may contain one or more asymmetric carbon atoms and may therefore occur as racemates and racemic mixtures, single enantiomers, diastereomeric mixtures and individual diastereomers. Furthermore, where a compound of the invention contains an olefinic double bond, this can have the (E) or (Z) configuration. Also, each chiral center may be of the R or S

configuration. All such isomeric forms of these compounds are embraced by the present invention.

Compounds of formula I which are acidic can form pharmaceutically acceptable salts with bases such as alkali metal hydroxides, e.g. sodium hydroxide and potassium hydroxide; alkaline earth metal hydroxides, e.g. calcium hydroxide, barium hydroxide and magnesium hydroxide, and the like; with organic bases e.g. N-ethyl piperidine, dibenzylamine, and the like. Those compounds of formula I which are basic can form pharmaceutically acceptable salts with inorganic acids, e.g. with hydrohalic acids such as hydrochloric acid and hydrobromic acid, sulphuric acid, nitric acid and phosphoric acid, and the like, and with organic acids, e.g. with acetic acid, tartaric acid, succinic acid, fumaric acid, maleic acid, malic acid, salicylic acid, citric acid, methanesulphonic acid and p-toluene sulphonic acid, and the like. The formation and isolation of such salts can be carried out according to methods known in the art.

Also part of the present invention are known purine and pyrimidine nucleoside derivatives for use in medicine, especially for use in the treatment of an Hepatitis C Virus (HCV) infection, where no medical use for those compounds is previously known, and pharmaceutical compositions containing the same.

Assay Method: The activity of the compounds was assayed using an adaptation of the method reported by Lohmann et al [V. Lohmann et al., Science, 1999, 285, 110-113].

HCV Replicon Assay:

The HCV replicon-containing cell line is used for the identification of small molecules that are able to inhibit the replication of the replicon RNA. Since the replicon RNA replication mimics the replication of the HCV RNA in infected hepatocytes, it is believed that those small molecules that have the above property are interesting for further development as anti-HCV drugs.

The inhibition of the HCV replicon RNA replication will lead to a decrease of the replicon RNA in the cell, which can be measured using a method that specifically quantifies this RNA.

Northern blot: One method for quantification of this RNA uses the standard Northern blot known to any person skilled in the art.

Kinetic PCR: A second assay for the quantification of replicon RNA is based on the amplification of the replicon RNA that remains in the cell, after incubation of the cells with a proper concentration of the small molecules. This method involves the reverse transcription of the replicon RNA to the corresponding complementary DNA (cDNA), followed by amplification of the cDNA using the Taqman Kinetic PCR technology (PE Biosystems). This consists of hybridisation of the cDNA with a complementary reporter oligonucleotide (probe), containing a combined fluorescent dye and a quencher dye. Amplification of the DNA sequence containing the hybridised reporter probe, using flanking oligonucleotide primers will lead to the separation of the fluorescent dye from the quencher dye. This will result in an increase of the fluorescence during each amplification cycle.

The neomycin phosphotransferase gene sequence that is present in the replicon RNA was chosen for amplification using specifically designed oligonucleotide primers. To control for *(a)* cell number that can vary depending on the toxicity or cytostatic effect of the small molecules, and *(b)* for errors during total RNA extraction, amplification of the host β-actin gene is used for normalisation.

The accumulation of the PCR products during the reaction is monitored directly by measuring the increase in fluorescence of the reporter dye. The amount

of HCV replicon RNA (and β-actin RNA) originally present in the total RNA extracted from the cells is then expressed as a threshold cycle, e.g. the cycle at which there is a statistically significant increase in the fluorescence above the background.

For this procedure, HCV replicon-containing human hepatoma Huh7 cells (9-13) in growth medium (DMEM) containing 5% FCS are plated in a 96-well plate at $5x10^3$ cells per well, and the plate incubated overnight. 24 hours later, different dilutions in 0.1ml growth medium of chemical compounds were added to the wells, and the plate further incubated at 37°C for three days. Total RNA coming from each well is extracted using the RNeasy™ procedure (Qiagen manufacturer instructions), and the total RNA is eluted in a final volume of 0.13ml. Next, a 2µl sample of the total RNA is used for convertion into cDNA using a reverse transcription (RT) step. A RT mastermix containing 1µl 10x Taqman RT buffer, 2.2µl 25mM $MgCl_2$ (5.5mM final conc.), 2µl dNTP mix (500µM each), 0.5µl random hexamer primers (2.5µM), 0.2µl RNase inhibitor (0.4u/µl), 0.25µl RT (1.25u/µl), 1.85µl H_2O, was distributed in a 96-well plate and 2µl total RNA was added to each well. The RT reaction is performed by incubation of the plate 10 min at 25°C, 30 min at 48°C, 5 min at 95°C and cooling to 4°C. The cDNA samples are then stored at -20°C or directly used for the PCR reaction. For the PCR reaction, the cDNA is diluted by addition of 90µl water, and 10µl of each diluted cDNA sample is added in duplicate to each well of a 96-well optical plate containing 12.5µl Taqman Universal PCR mix (PE Biosystems), 1.25µl 20x Replicon probe/primer mix (Primers 300nM, Probe 100nM), 1.25µl 20x β-actin probe/primer mix (PDAR PE Biosystems). A standard curve is generated for each plate by including in duplicate five 3-fold dilutions of cDNA derived from total RNA extracted from 9-13 cell that were incubated in the absence of chemical compounds. A negative control is included in the plate by omitting the cDNA sample (no template control). Each well of the optical plate is secured with a lid and the plate is mixed. The plate is centrifuged for a few seconds at 3000 rpm to ensure contents are at the bottom of each well. The plate is then inserted into the 7700 Kinetic PCR machine and the reaction started using the default settings.

The concentration of the drug (IC_{50}) required to reduce replicon RNA levels by 50% relative to the untreated 9-13 cell control value, can be calculated from the plot of percentage replicon RNA reduction vs. drug concentration.

Renilla Luciferase reporter: A third assay is based on the idea of using a reporter as a simple readout for intracellular HCV replicon RNA level. For this purpose the Renilla luciferase gene was introduced into the first open reading frame of a replicon construct NK5.1 (Krieger *et al.*, J. Virol. 75:4614), immediately after the internal ribosome entry site (IRES) sequence, and fused with the neomycin phosphotransferase (NPTII) gene via a self-cleavage peptide 2A from foot and mouth disease virus (Ryan & Drew, EMBO Vol 13:928-933). After *in vitro* transcription the RNA was electroporated into human hepatoma Huh7 cells, and G418-resistant colonies were isolated and expanded. Stably selected cell line 2209-23 was shown to contain replicative HCV subgenomic RNA, and the activity of Renilla luciferase expressed by the replicon reflects its RNA level in the cells.

For the assay procedure, Renilla Luciferase HCV replicon cells (2209-23) that cultured in Dulbecco's MEM (GibcoBRL cat no. 31966-021) with 5% fetal calf serum (FCS) (GibcoBRL cat no. 10106-169) were plated onto a 96-well plate at 5000 cells per well, and incubated overnight. Twenty-four hours later, different dilutions of chemical compounds in the growth medium were added to the cells, which were then further incubated at 37°C for three days. The assay was carried out in duplicate plates, one in opaque white and one in transparent, in order to measure the activity and cytotoxicity of a chemical compound in parallel ensuring the activity seen is not due to reduction on cell proliferation.

At the end of the incubation time, the cells in the white plate were harvested and luciferase activity was measured by using a Dual-Luciferase reporter assay system (Promega cat no. E1960). All the reagents described in the following paragraph were included in the manufacturer's kit, and the manufacturer's instructions were followed for preparations of the reagents. Briefly, the cells were washed twice with 200µl PBS (phosphate buffered saline; pH 7.0) per well and lysed with 25µl of 1x passive lysis buffer prior to incubation at room temperature for 20 min. One hundred microlitre of LAR II reagent was added to each well. The plate was then inserted into the LB 96V microplate luminometer (MicroLumatPlus, Berthold), and 100 µl of Stop & Glo reagent was injected into each well by the machine and the signal measured using a 2-second delay, 10-second measurement programme. The IC_{50}, the concentration of the drug required for reducing the replicon level by 50% in relation to the untreated cell control value, can be calculated from the plot of the percentage reduction of the luciferase activity vs. drug concentration.

Dosing for the human body with compounds of formula I:

The compounds according to the invention may be employed alone or in combination with other therapeutic agents for the treatment of hepatitis C virus infections.

The compound of formula I whether administered alone or in combination with other therapeutic agents may be administered orally in capsule, tablet or liquid form. Other types of administration could also be contemplated such as nasal spray, transdermally, by suppository, by sustained release dosage form and by pulmonary inhalation, as long as adequate dosages are delivered without destroying the active ingredient.

The amount of the compound of formula I required for the treatment of hepatitis C virus infections will depend on a number of factors including the severity of the disease and the identity, sex and weight of the recipient and will ultimately be at the discretion of the attendant physician. In general, however, a suitable effective dose is in the range of 0.05 to 100mg per kilogram of body weight of the recipient per day, preferably in the range 0.1 to 50mg per kilogram of body weight per day and most preferably in the range of 0.5 to 20mg of body weight per day. An optimum dose is about 2 to 16mg per kilogram body weight per day. The desired dose is preferably presented as two, three, four, five , six or more sub-doses administered at appropriate intervals throughout the day. These sub-doses may be administered in unit dosage forms, for example, containing from 1 to 1500mg, preferably from 5 to 1000mg, most preferably from 10 to 700mg of active ingredient per unit dosage form.

Combination therapies comprise the administration at least one compound of formula I or a physiologically functional derivative and at least one other physiologically acceptable agent. The active ingredient(s) and physiologically acceptable agent(s) may be administered together or separately and when administered separately this may occur simultaneously or sequentially in any order. The amounts of the active ingredient(s) and physiologically acceptable agent(s) and the relative timings of administration will be selected in order to achieve the desired combined therapeutic effect. Preferably the combination therapy involves the administration of one compound of formula I or a physiologically functional derivative and interferon alpha. The interferon alpha administered is preferably selected from interferon alpha 2a, interferon alpha 2b, a consensus interferon, a purified interferon alpha product or a pegylated interferon alpha 2a or a pegylated interferon alpha 2b. Preferably the amount of interferon alpha administered is from 2 to 10 million IU per week on a weekly, TIW, QOD or daily basis. The preferred method of administering the interferon alpha or pegylated interferon alpha formulations is parenterally, preferably by subcutaneous, IV, or IM injection.

It is preferable to administer the compound of formula I as a pharmaceutical formulation. The formulations of the present invention comprise at least one active ingredient of formula I together with one or more pharmaceutically acceptable exipients and optionally one or more other therapeutic agents. Formulations for oral administration may be capsules, cachets or tablets each containing a predetermined amount of active ingredient(s) may be prepared by any method well known in the art of pharmacy. As well as the active ingredients(s) the oral formulation may contain a binder (for example povidone, gelatin, hydroxypropylmethyl cellulose), a lubricant, inert diluent, preservative, disintegrant (for example sodium starch glycollate, cross-linked povidone, cross-linked sodium carboxymethyl cellulose) or a dispersing agent. Formulations for oral use may also include buffering agents to neutralise stomach acidity.

Example:

Tablets containing the following ingredients may be produced in a conventional manner:

Ingredient	per tablet
Compound of formula I	100mg
Lactose	131mg
Microcrystalline cellulose	60mg
Croscarmellose sodium	6mg

The solution was stirred at room temperature for 2 hours. A few drops of glacial acetic acid was added and the mixture evaporated to dryness. The solid residue was purified by flash column chromatography on silica gel using ethyl acetate/isohexane for the elution to give 50mg of 5-ethyluridine (C. Nakayama et al, J. Carbohyd. Nucleosides and Nucleotides, 1979, 6, 295) of melting point 180-181°C; mass spectrum (ESI) 273$[M+H]^+$.

A mixture of 0.3 g of 3-acetoxymethyl-1,2,5-tri-O-acetyl-3-deoxy-β-D-ribofuranose (prepared by the procedure of R. M. Sterzycki et al Eur.Pat.Appl. 391411), 0.457g of N-acetylcytosine and 0.74 ml of bis-trimethylsilylacetamide in 15 ml of anhydrous acetonitrile was heated under reflux for 2.5 hours to give a clear solution. The solution was cooled and treated with 0.28 ml of trimethylsilyl trifluoromethanesulphonate then heated at 50°C for 3 days. The pale yellow solution was diluted with 100 ml of ethyl acetate and washed with 50 ml of 1M hydrochloric acid, 50 ml of saturated sodium hydrogen carbonate then brine. The solution was dried over anhydrous magnesium sulphate, filtered and evaporated. The residue was purified by flash chromatography on silica gel using methanol/dichloromethane (1:19) for the elution to give 55 mg of 4-N-acetyl-1-(3-acetoxymethyl-2,3-di-O-acetyl-3-deoxy-β-D-ribofuranosyl)cytosine; mass spectrum (ESI) 426$[M+H]^+$.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/EP 01/09633

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. [X] Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

Although claim 55 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound.

2. [X] Claims Nos.: 43,49-57 (all partially)
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

see FURTHER INFORMATION sheet PCT/ISA/210

3. [ ] Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

As a result of the prior review under R. 40.2(e) PCT, no additional fees are to be refunded.

1. [X] As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

[X] The additional search fees were accompanied by the applicant's protest.

[ ] No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 43,49-57 (all partially)

The initial phase of the search revealed a very large number of documents relevant to the issue of novelty for claim 43. So many documents were retrieved that it is impossible to determine which parts of the claim may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT). For these reasons, it appears impossible to execute a meaningful search and/or to issue a complete search report over the whole breadth of the claims. Consequently, the search and the report for this claim has been restricted to the case where R13''''' is an alkyl but not methyl.

Present claims 49-57 relate to an extremely large number of compounds. In fact, the claims contain so many options, that a lack of clarity (and/or conciseness) within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible. Consequently, the above mentioned claims have been searched insofar as the compounds of claim 49 fall within earlier compound claims.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
